Failure consideration:

Slenderness ratio =
$$P$$
 Radius of Gyration = $P = \int \overline{A}$
Second moment of avea $I = \frac{bd^3}{12} m^4 = 0.02 \cdot \frac{0.002^3}{12} m^4 = 1.33 \times 10^{-11}$

$$\int_{4}^{2} \frac{10^{-11}}{4^{10^{-5}}} = 0.57bb \times 10^{-3}$$

$$\int \frac{2\pi^2 \bar{e}}{59} = \int 2\pi^2 \frac{69.5 \times 10^9}{120 \cdot 10^6} = 106.92$$

estimates show a stenderness ratio above the material properties ratio. Euler's buckling will be used

These correspond to our input force out the tie of
$$\frac{2}{13}$$
 for

$$I = \frac{db^{3}}{12} = 0.002 \cdot \frac{\partial 0.2^{3}}{12} = 1.33 \times 10^{-7}$$

$$A = \int_{-1}^{1} d = 4 \times 10^{-7}$$

$$A = \int_{-1}^{1} \frac{1.53 \times 10^{-7}}{4 \times 10^{5}} = 0.576 \times 10^{-1}$$

$$\frac{1}{4} = 0.576 \times 10$$

$$\frac{1}{4} = 2.60$$

$$\int \frac{1}{2} \frac{1}{3} \frac{1}{3} = \frac{100.92}{100.92}$$

$$P C = \left[\frac{5y}{4} - \frac{5y^{2}}{4\pi^{12}} \left(\frac{1e}{p} \right)^{2} \right] A$$

$$= \left[\left[\frac{20x \cdot 0^{3}}{4} - \frac{35478}{4} \right] 4 \times 0^{-5} \right]$$

axial compression

At two end around pin:
$$F = \frac{5y \cdot A}{k} = \frac{120 \text{ mpn} \cdot (22 \text{ mm}^2)}{3.6} = 40 \text{ bb. bb. N}$$

for more larger than budging. hence axial compression are not likely to cause failure.
